

Selenium 3.x Setup For Windows

This is important to set geckodriver path to run Firefox Browser using Selenium 3.x version

Download latest geckodriver from this location:

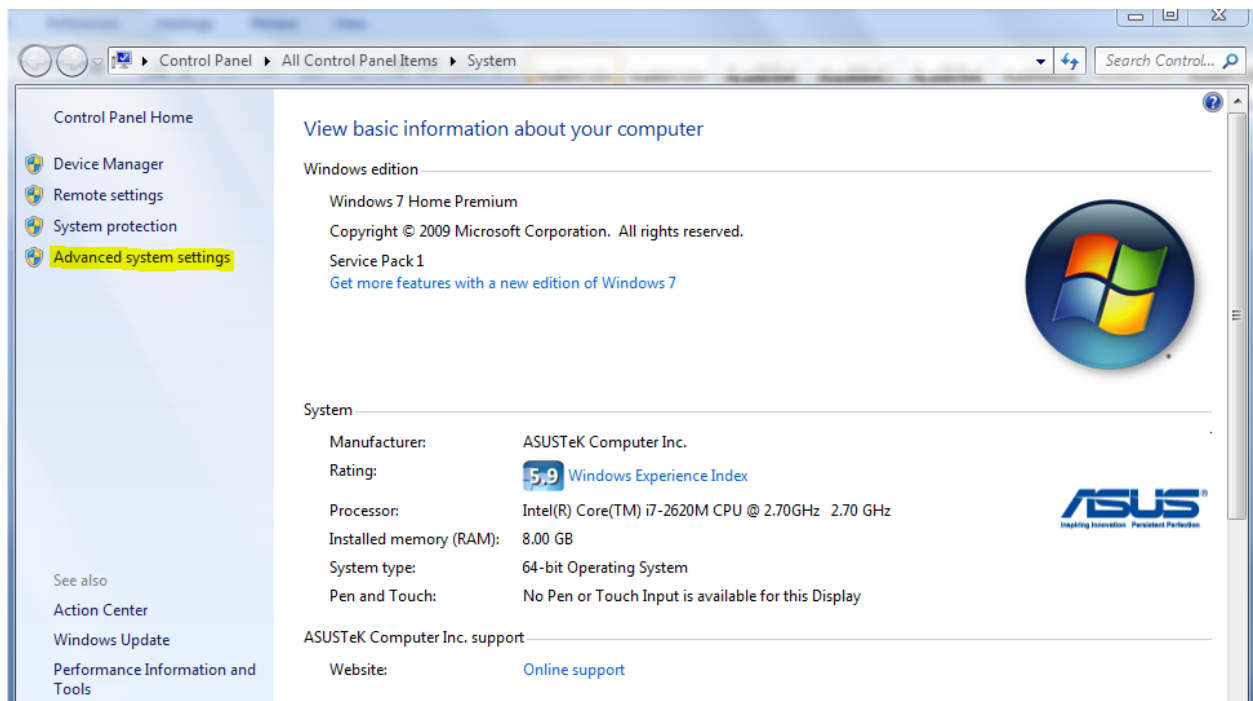

<https://github.com/mozilla/geckodriver/releases>

Extract the geckodriver and save the geckodriver at any location:

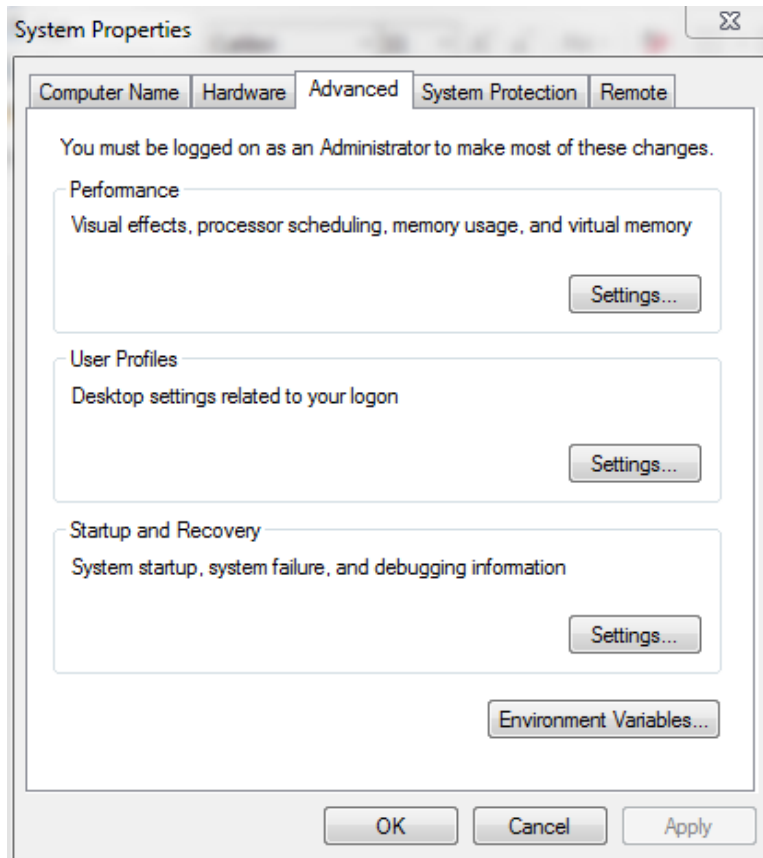

1. Assume you have the folder with the name workspace under your username
2. Navigate to the project location using Windows Explorer
3. Create a folder and name it "lib"
4. Copy the extracted file to this location
5. Get the complete path of the location
6. Example path: C:\Users\username\workspace\libs

Configuration:

- Go to My Computer -> Properties -> Advanced System Settings

- Click on Environmental Variable

- In system Variable, select the Path and click Edit
- Enter the following information in the variable value:

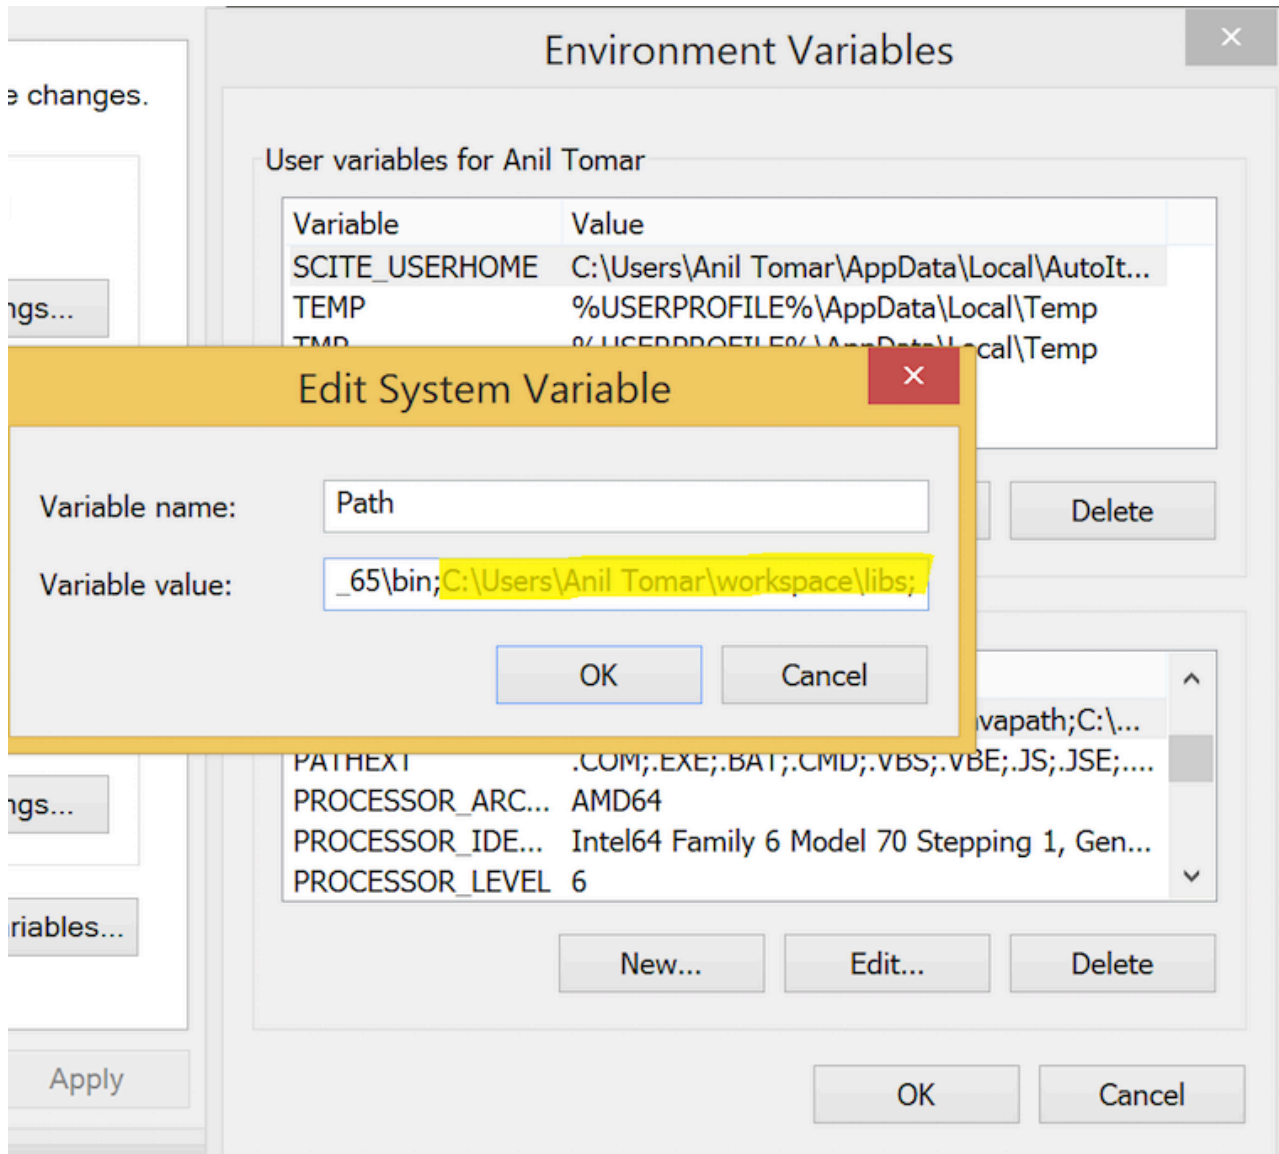

C:\Users\username\workspace\libs

- Click OK button
- **Restart the system.**

NOTE: Multiple directories needs to be separated by semi colon For Example: C:\Program Files; C:\Users\username\workspace\libs

NOTE: geckodriver.exe name should not be in the path, only the folder location should be in the path

Image is attached below

If you see this error message:

Traceback (most recent call last):

```

    binary location, but unable to find binary in default location, no
    'moz:firefoxOptions.binary' capability provided, and no binary flag set on the
    command line
```

Process finished with exit code 1

Then please follow these steps:

Find the location of your Firefox installation.

Usually it is -> C:\Program Files (x86)\Mozilla Firefox\firefox.exe

Add this to your code like this:

```
def test(self):  
    binary = FirefoxBinary('C:\\Program Files (x86)\\Mozilla Firefox\\firefox.exe')  
    driver = webdriver.Firefox(firefox_binary=binary)  
    driver.get("http://www.letscodeit.com")
```
